Bikers won't fit anything else

Around the world bikers and bike manufacturers agree that when it comes to spark plugs, one plug is king. NGK. Which is why they are the world's No.1 OE fitment. So don't try fitting anything else.

You have been warned.

This catalogue lists only vehicles officially imported or manufactured in the UK and is effective from November 2011 and supersedes all previous catalogues. Whilst every care is taken in compiling these lists of applications, they are given for general guidance only, and they do not constitute any contractual term, representation or warranty and as such NGK do not accept any responsibility in respect of any claim whatsoever and howsoever caused arising from the publication of this catalogue.

The appropriate NGK Spark Plugs are designed solely for use in automotive, motorcycle, marine, horticultural, agricultural, commercial, industrial, and all stationary engines.

NGK Spark Plugs should not be used in aircraft engines.

Resistor plugs should always be used where they are recommended by the manufacturers. The use of non-resistor plugs, could, in some cases, result in damage to electronic components.

Vitius nemo sine nascitur

SPARK PLUG DESIGN

SPARK PLUG DESIGN

Every year the range of NGK spark plugs grows to accommodate the ever increasing demands of modern engines. Spark plug design must take into consideration many features of an engine including physical dimensions, combustion chamber shape, cooling abilities, fuel and ignition systems. Spark plugs play a vital role in producing the maximum power from an engine whilst keeping fuel consumption and emissions to a minimum. Choosing the correct spark plug type will help a vehicle manufacturer meet legislated emission targets and assists the motorist in getting the best from their engine.

Increases in the size and the requirement to improve the cooling of the inlet and exhaust valves have meant that the space available for the spark plug is severely restricted on some cylinder heads. A change in spark plug design, possibly the adoption of a taper seat and extended reach (threaded portion) or even the use of a smaller diameter is often the answer. Some engines require the use of two spark plugs per cylinder and again due to space restrictions these might be of different sizes.

Changes in fuelling systems and the fuel itself have meant some special features being adopted at the 'firing end' of the spark plug. Extra projected types push the spark position into the heart of the combustion chamber to promote better combustion of the fuel/air mixture, which is weaker than ever in an effort to improve economy. Modern engine manufacturers often require increased spark gaps to allow a longer spark duration, which again aids more efficient combustion.

To combat the 'cold fouling' effect that can occur in some engines using unleaded fuels specially arranged ground electrodes are sometimes used. These can force the spark to discharge across the insulator and thus burn away any built up carbon that could cause poor starting or misfires. It is not uncommon to find two, three or four ground electrode arrangements in new vehicles. The use of precious metals on the tips of the spark plug electrodes is not uncommon especially on higher performance engines. Whilst these spark plugs do have increased service life they are often specified because of their superior ignition qualities.

Our engineering departments work very closely with the engine and vehicle manufacturers to produce the ideal spark plug type for each application. Any change in production is expensive for a manufacturer and therefore new spark plug types are only produced where necessary. NGK employ the very latest production technology to ensure that every aspect is catered for – performance, economy and value.

HEAT RANGE AND HEAT DISSIPATION

Spark plugs do not produce heat in the combustion chamber. One of the functions of the spark plug is to dissipate some of the heat produced during combustion. This is mostly transferred into the cylinder head. The 'Heat Range' indicates the measure of the spark plug's ability to do this. A 'hot' spark plug is designed to maintain a sufficiently high temperature at the insulator nose to burn off carbon and oil deposits. A 'cold' spark plug is designed to allow a faster transfer of heat to the cylinder head thus preventing overheating and premature failure.

The heat range selection is obviously a complex task with many factors to take into account. NGK engineers therefore make specific recommendations for each engine and the use to which it is put.

NGK'S COPPER CORE TECHNOLOGY

WIDE HEAT RANGE

A wide range spark plug is more flexible and performs equally well in a hot or cold engine under stop and go city driving or fast motorway cruising. Engines that tend to run hot need cold type plugs. Those that run cold demand a hotter type. The specific plug for any engine is determined by the plug's heat range. That is the minimum and maximum temperatures between which the plug will offer optimum performance.

The heat range of NGK Spark Plugs is wider than ordinary plugs therefore they are suitable for both high speed and low speed driving. Compared with conventional plugs of the same pre-ignition rating they have more resistance to fouling. Compared to ordinary plugs with equal anti-fouling resistance, NGK Spark Plugs have a higher pre-ignition rating.

NGK'S HEART OF COPPER

Copper wire used in place of the iron core in conventional plugs is the secret of NGK's Wide Heat Range. Copper's superior heat conductivity dissipates heat quicker. It cools the electrode tip and insulator tip which prevents hot spots that could cause pre-ignition. Increased heat resistance does not affect fouling resistance, which is primarily determined by the insulator nose length. The longer the nose, the more susceptible it is to heat and the more free from fouling. By raising the pre-ignition rating with the high conduction copper and leaving the insulator nose long, NGK produces the Wide Range Plug. One that meets the broad thermal requirements of engines under high and low RPM conditions. With the exception of a couple of older applications all the spark plugs in this motorcycle catalogue employ copper core technology.

FIRING END APPEARANCE

<p>Firing end temperature °C</p> <p>Overheating area</p> <p>870°</p>		<ul style="list-style-type: none"> • Overheating The insulator is white and sometimes blistered. If the insulator temperature is over 870°C pre-ignition may occur. Engine power will be reduced and the piston may be damaged. 	<ul style="list-style-type: none"> • Causes • Over advanced ignition timing • Too lean a fuel mixture • Blocked injectors • Insufficient cooling • Excessive deposits in the combustion chamber
<p>Optimum temperature area</p> <p>450°</p>		<ul style="list-style-type: none"> • Good condition The insulator is brown or light grey. 	<p>Even if the spark plug is used under good conditions, deposits will accumulate. Regular inspection and replacement is advisable.</p>
<p>Fouling area</p> <p>Idle Temp { 250° 150°</p>		<ul style="list-style-type: none"> • Fouling Carbon accumulates on the insulator nose forming a leakage path to earth. The engine misfires resulting in bad starting and poor acceleration. Particularly common with unleaded fuel. 	<ul style="list-style-type: none"> • Causes • Too rich a fuel mixture • Excessive use of choke • Prolonged slow speed driving or idling • Blocked air filter • Spark plug heat range too cold

THE BEST SPARK PLUG FOR EVERY OCCASION

As a result of our policy of continuous research and development NGK can offer special spark plugs designed to give optimum performance under a high range of conditions.

'S' TYPE (e.g. BP6ES)

NGK standard spark plugs with copper cored centre electrodes for wide heat range. Copper's superior heat conductivity dissipates the heat of combustion away from the firing end, preventing hot spots that can lead to pre-ignition. Copper cored electrodes also mean that longer insulator noses can be used to protect against fouling.

'G' TYPE (e.g. B10EG)

These plugs feature a smaller diameter centre electrode tip made of conventional nickel alloy. The smaller diameter centre electrode means the voltage required to produce a spark is reduced. However as the tip is made of conventional nickel alloy the service life is reduced and these plugs are best used in applications where plugs are frequently changed.

'V' TYPE (e.g. B10EV)

The centre electrode of this type is made of gold palladium alloy and is even smaller in diameter than the G type at 1.0mm and has therefore an even lower voltage requirement. These 'V' types have now been discontinued and replaced with 'VX' or 'IX' equivalents.

'GV' TYPE (e.g. B9EGV)

These plugs have a centre electrode of precious metal similar to the V range. In addition the insulator nose is an improved design to allow better gas flow around the firing end. The ground electrode is shorter and stronger, making the GV range more suited for racing applications.

'VX' TYPE (e.g. B8EVX)

These plugs have an even smaller centre electrode (0.8mm) than the V types and this is made of platinum. This combined with a taper cut ground electrode means an even lower required voltage than the V types. The result is better ignitability along with improved starting, idle stability and anti-fouling performance.

'IX' TYPE (e.g. BR8EIX)

Similar in design to the Platinum VX spark plug, the use of the precious metal Iridium allows us to manufacture a spark plug with an even smaller diameter centre electrode (0.6mm) without compromising durability. This extremely small Iridium tip centre electrode concentrates the available electrical energy and combined with the taper cut ground electrode provides the best performance in terms of starting, idling and especially throttle response.

FITTING THE CORRECT SPARK PLUG

NGK spark plugs are designed using the latest technology to give optimum performance over the engine's entire rev. range. Fitting the correct type of spark plug is essential. Many changes in engine technology has meant changes in spark plug design. Some NGK spark plugs may have a similar appearance, however the internal and or external design can differ sufficiently to cause engine damage should the incorrect part be installed. The examples below display some of the different design features employed in typical motorcycle applications and hopefully help to explain the reason for some application specific part numbers.

CR8EH-9

- Used on some Honda designed engines
- Special thread can only be used in specific engines or the cylinder head will be damaged

BR10ECM

- Compact style, mainly used by Honda and Suzuki
- For use where space is restricted

CR6HSA

- Centre electrode is 0.2mm wider than CR6HS for improved durability
- Short metal shell design

CR9EK, JR9C

- Used by Kawasaki and Suzuki
- 2 ground electrodes for improved durability

CR9EK thread diameter \varnothing 10mm

JR9C thread diameter \varnothing 12mm

ER9EH

- Used by Honda, \varnothing 8mm thread with 13mm hex
- Do not exceed the tightening torque of 0.8 - 1.0kg/m

B9ECS

- Short ground electrode for strength and to prevent overheating
- For competition use

THE IRIIDIUM IX SPARK PLUG

The Iridium IX spark plug is similar in design to the Platinum VX type but benefits from the use of the precious metal Iridium on its centre electrode. Iridium is harder than other precious metals used in spark plug manufacture, has an extremely high melting point and offers greater protection from chemical attack. These features allow the use of an extremely small diameter electrode (0.6mm) without compromising the spark plug's service life. Combined with the use of the taper cut ground electrode this spark plug has superior gas flow properties and lower voltage requirements, which offers further improvements in starting, idling and throttle response.

BR8EIX

Iridium spark plugs are used by some of the worlds leading race teams and as original equipment in many high performance road and off road machines. Owners who want the very best performance from their bikes will want the best spark plug and this we can offer with Iridium IX.

Iridium IX
A small diameter electrode that gives good gas flow and less restriction of flame kernel

Iridium IX packaging

The close up section shows the annular gap between the centre electrode and insulator nose which provides cold fouling protection.

Should current try to leak away across a carbonised insulator a spark can occur between the electrode and the insulator thus burning away the carbon deposit.

THE IRIIDIUM IX SPARK PLUG

The tables below show the Iridium IX upgrade from standard copper core and Platinum VX type. For specific model application refer to the Iridium column in the main data pages.

For plugs with threaded terminal

As the IX range now takes over the premium motorcycle spark plug position from the popular Platinum VX range we will be superseding some current versions of Platinum VX types as volume production allows. This will be treated as a running change and therefore orders placed for certain resistor VX types will be fulfilled by supplying the Iridium IX equivalent. Most contemporary machines demand the use of resistor types and most older machines can and do use them quite happily.

Below is a chart to show the VX plugs currently affected.

SPARK PLUG INSTALLATION TIPS

- Refer to current NGK catalogue for correct spark plug selection
- Check condition and cleanliness of threads in cylinder head
- Ensure plug is gapped according to vehicle manufacturers specification (*fig 1*)
- Multi ground electrode and precious metal plugs should not be regapped - visual inspection only
- Install new spark plug *by hand* until it seats - (*fig 2*) a length of rubber tubing pushed over the insulator can be a useful aid for plug installation where access is difficult
- Tighten to specified torque setting as shown in the chart below (*fig 3*)
- If a torque wrench is unavailable then refer to vehicle/engine manufacturers installation instructions or the tightening angle advice which is displayed on current NGK packaging (excluding specialist race plugs). Note that this angle advice can differ between part numbers due to individual spark plug design (e.g. seating type, thread diameter and gasket material)
- It is important not to over or under tighten spark plugs during installation. Over-tightening can lead to distortion of the spark plug. Under-tightening can cause overheating due to poor heat dissipation. *In extreme cases incorrect tightening can cause spark plug breakage and/or engine damage*
- NGK does not recommend the application of lubricant to spark plug threads as the resultant reduction of frictional forces at the thread faces will render the torque charts inaccurate and over tightening could occur
- If a gasket type spark plug is re-installed, it should only require a further 1/12 of a turn after it has been seated
- Always carefully use the correct tools for removal/installation to prevent damage to the spark plug or engine
- Inspect spark plug cover and renew if necessary

③	FOR FLAT SEAT TYPE (WITH GASKET)					TAPER SEAT TYPE

‡ Early Ducati Testastretta bikes (749, 998, 999 models) can have very little clearance between the plug hex and the cylinder head that may require a thin walled socket, no larger than 20.5mm OD to allow the plug to be fitted.

* Please note DCPR8E 4339 has a removable terminal nut, whereas DCPR8E 4179 has a fixed terminal nut

SPARK PLUG GAP SETTINGS

Important: Spark plug gap settings are given in millimetres.
Practical equivalents are shown below.

mm	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.1	1.3	1.4	1.5	1.6	1.8	2.0
ins	.016	.020	.024	.028	.032	.035	.039	.043	.051	.055	.059	.063	.071	.079

CONVERSION CHART

IMPORTANT:

This chart is furnished as a guide only. Certain design differences may exist between our spark plugs and another manufacturers; heat ratings can also vary. Always refer to the main application data to select the recommended spark plug for specific engines.

SPARK PLUG COVERS

STANDARD PLUG COVERS

EPDM RUBBER PLUG COVERS

The NGK range of resistor covers are designed to give perfect noise suppression across all frequencies whilst engine performance is not adversely affected whatsoever.

Featuring a resistor element pressed in between the plug terminal and the high tension wire connection, the construction is extremely durable, the resistor element is long enough to prevent interior flashover, and steady resistance is maintained. Superlative ceramic materials are incorporated that resist deterioration and have small resistance variation under over-load, whilst the plug connector is made of sturdy phenolic resin, practically oblivious to tremendous heat and high tension, and very rugged rubber material. The heat press insertion makes the construction all the more tough and vibration-resistant. Special rubber liners on both ends prevent moisture from causing electrical leakage.

All motorcycle manufacturers now comply with current legislation which demands a standard of noise suppression on every vehicle. This is achieved usually by fitting NGK resistor covers though in many cases a combination of NGK resistor covers and NGK resistor spark plugs (R type) is necessary to satisfy the ministry tests. It is emphasized that despite the use of both resistor covers and spark plugs in such engines, due to the unique and superior construction of NGK products there is no loss of performance or shortening of service life.

LBO5EMH and SDO5FM being of tough EPDM rubber construction are intended for competition/trial applications.

COVER SYMBOLS EXPLANATION CHART

To assist in identifying the red or blue coloured variant for popular plug covers a small change to the descriptive part number has been instigated. Implementation will be managed on a running change basis i.e. when current stocks are exhausted orders will be fulfilled by supplying the replacement item. There is no change to the Stock Number. Black covers which are considered standard are unaffected.

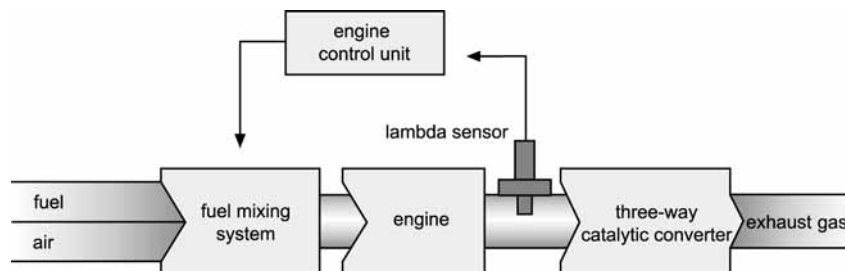

NTK LAMBDA SENSORS FOR MOTORCYCLES

Reducing the pollution created by the internal combustion engine is a great concern for us all. To ensure that manufacturers build cleaner engines the allowable limits for certain polluting gases are set by various government bodies. These limits are getting ever tighter and engine designers are under great pressure to find ways of meeting the targets. A vital part of the pollution control used on many engines is the exhaust gas oxygen sensor - more commonly known as the Lambda sensor. Commonplace on cars since the 1990's, Lambda sensors have been used on motorcycles since 1999 and are now fitted to an increasing number of machines over 125cc.

WHAT DOES THE LAMBDA SENSOR DO?

The most popular method used by vehicle manufacturers to reduce engine emissions is the three-way catalyst (catalytic converter). This device has the ability to take the three main toxic gases produced by an engine which are carbon monoxide (CO), oxides of nitrogen (NO_x) and hydrocarbons (HC) and convert them to considerably less harmful, non-poisonous gases: carbon dioxide (CO₂), water (H₂O) and nitrogen (N₂).

To carry out this conversion of gases efficiently the catalyst must operate within a specified temperature range but also be provided with exhaust gases that are within certain very tight tolerances dependant predominantly on air/fuel ratio. The precise control required to operate this system is provided by the use of an exhaust gas oxygen (Lambda) sensor installed upstream of the catalyst. A Lambda sensor has the ability to precisely measure the residual oxygen present in exhaust gases. By sending a signal to the control unit it can initiate a change to keep the fuelling system operating within the very tight tolerances required. This is known as a closed-loop control system.

A worn or damaged sensor may affect the bike's general performance, increase fuel consumption, increase unwanted emissions and even damage the catalyst.
